SUMMARY

Data Analyst with 2+ years turning fragmented data into reporting people trust, using SQL, Python, Power BI, and Tableau. Built the KPI framework and automated dashboards that replaced years of manual board reporting, then standardized six years of fragmented records to cut data-cleaning time 40%. Also built a demand forecast in apparel manufacturing that cut excess inventory 18% and freed cash tied up in inventory.

TECHNICAL SKILLS

- **Languages:** SQL, Python, R
- **Warehouses & Databases:** Snowflake, Databricks
- **BI & Reporting:** Power BI, Tableau, Looker Studio, Excel
- **Analytics:** Demand forecasting, seasonality analysis, KPI framework design, dashboard automation, self-serve reporting, data standardization and quality validation
- **Platforms & Automation:** Salesforce, LLM-assisted data pipelines, Google Apps Script, REST APIs
- **Business:** Stakeholder management, requirement elicitation, data storytelling for non-technical audiences

PROFESSIONAL EXPERIENCE

YourPassion1st, Remote **April 2026 - Present**

Data Analyst, Volunteer

- Built an automated survey pipeline in Google Sheets Apps Script that processes Typeform responses across program years without manual cleanup, using keyword-based question mapping to absorb changing survey wording.
- Structured the output into canonical and dashboard layers feeding Looker Studio, so reporting refreshes as responses arrive, and support Salesforce dashboarding for program reporting.

Life Science Cares, Boston, MA **June 2025 - August 2025**

Data Analyst Intern

- Built one longitudinal dataset from six years of fragmented records across five cities, defining a consistent schema and standardizing company, university, major, and demographic values with AI-assisted cleanup, cutting manual cleaning time 40%.
- Translated leadership requirements into a KPI framework, defining the North Star metric and supporting input, process, output, and outcome metrics, then designed the collection template so every future cohort captures the same fields from placement to 6-12 month career outcomes.
- Built Power BI dashboards on an automated refresh tracking placements, demographic reach, volunteer engagement, and professional development, one for the board and one for partner companies, and benchmarked results against peer programs for context the internal data couldn't provide.

FourBlock, New York, NY **January 2025 - April 2025**

Data Analyst Intern

- Built a Python sentiment analysis pipeline that scored 1,200+ open-ended survey responses, replacing about a week of manual reading and surfacing the specific program areas participants felt needed improvement.
- Extracted 5+ years of Salesforce data with SQL across 1,000+ participants, evaluating before-and-after skill gains and in-person versus virtual delivery to identify format-driven outcome differences.
- Redesigned the alumni survey to improve low response rates, cutting it into four focused sections and showing a shorter format kept data quality while increasing participation.

Golden Eyes Garments, Tirupur, Tamil Nadu, India **July 2022 - July 2024**

Data Analyst

- Owned weekly operations reporting across orders, inventory, and production, combining scattered team data into one central dataset with Tableau and Excel dashboards that leadership used to run weekly planning, saving 8–10 hours of manual reporting per week.
- Built a demand forecast in Python from order history and seasonality that the merchandising team used to plan yarn and fabric purchases, reducing excess inventory 15–20% and freeing ₹40L–₹60L (about $50K–$75K) in working capital.
- Analyzed production data across each stage to pinpoint what was delaying shipments, then worked with supervisors on scheduling changes that raised output 12–15% and improved on-time delivery from 78% to 91%.

PROJECTS

Weather-Driven Revenue Forecasting | Ledge Brewing Co, Intervale, NH **Spring 2025**

- Combined 3 years of point-of-sale data with daily New Hampshire and Boston weather data (pulled via API) using SQL and Python, to answer the owner's questions on staffing, event booking, and inventory planning.
- Built a Random Forest model to separate what drives weekend sales, finding that a normal weekend adds about $2.4K over a weekday and live music adds another $1.6K on top, so the owner could check whether a band's fee was worth paying.
- Found that Boston weather, not local weather, predicted how busy the brewery would be, since many customers travel in from the Boston area, and used it to raise the model's R^2 from 0.70 to 0.88, helping the owner plan staffing ahead of busy weekends.

EDUCATION

Northeastern University, Boston, MA | Master of Science in Business Analytics, D'Amore-McKim | CGPA: 3.7/4 **Dec 2025**

SRM University, Chennai, India | B.Tech, Electronics and Communication Engineering | CGPA: 7.76/10 **May 2022**
